The Future UI of Desktop Computers and Smartphones

We programmers rule the world. There are 100 million lines of code in a modern car.

Should we drop our ethical standards when working for giant corporations making obscene profits from marketing Ignorance and Arrogance?

Literate or Illiterate?

The modern Desktop UI has made every Literate person in the world (Computer) Illiterate.
Incorporating Menuindex with Limitations into the Desktop environment will give back the dignity to Literate people that they rightfully deserve.

The Future UI of Desktop Computers is:

Back to Blank.

Incorporating Menuindex with Limitations into the current UI, so users have a UI choice, will save the user's time, and recover the screen area lost because UI designers failed to comprehend that the keyboard is nearly as big as the screen, so cluttering up the screen with widgets, that can easily be selected from an alphabetic list, driven by the keyboard, shows a disregard for User Needs, as well as Ignorance and Arrogance.

Will a Desktop Application Developer seize this opportunity to incorporate Menuindex with Limitations into their product line?

The Future UI of Smartphones is:

Quadruple the screen size by incorporating Sliding Menus;
Unbrickable;
Re-purpose before Recycle.

Will a Chinese smartphone manufacturer seize this opportunity to launch the EZsmartphone concept to capture the markets of Apple and Google?
