

## CH-101 Datasheet

---

# CH-101 Datasheet

## GENERAL INFORMATION

The CH-101 is a miniature, ultra-low-power ultrasonic Time-of-Flight (ToF) range sensor. Based on Chirp’s patented MEMS technology, the CH-101 is a system-in-package that integrates a PMUT (piezoelectric micromachined ultrasonic transducer) together with an ultra-low-power SoC (system on chip) in a miniature, reflowable package. The SoC runs Chirp’s advanced ultrasonic DSP algorithms and includes an integrated microcontroller that provides digital range readings via I<sup>2</sup>C.

Complementing Chirp’s other ultrasonic ToF sensor products, the CH-101 provides accurate range measurements to targets at distances up to 1.2 m. Using ultrasonic pulse-echo measurements, the sensor works in any lighting conditions, including full sunlight, and provides millimeter-accurate range measurements independent of the target’s color and optical transparency. The sensor’s wide Field-of-View (FoV) enables simultaneous range measurements to multiple objects in the FoV.

## DEVICE INFORMATION

PART NUMBER	PACKAGE	LID OPENING
CH-101	3.5 x 3.5 x 1.26mm LGA	1-Hole

RoHS and Green-Compliant Package

## APPLICATIONS

- Augmented and Virtual Reality
- Drones and Robotics
- Mobile and Computing Devices
- Obstacle avoidance
- Printers and Scanners
- Proximity sensing
- Presence detection: always-on sensing to lock/unlock and power on/off notebooks, tablets, white goods, etc.
- Smart Home

## FEATURES

- Fast, accurate range-finding
  - Operating range from 4 cm to 1.2 m
  - Sample rate up to 100 samples/sec
  - 1.0 mm RMS range noise at 30 cm range
  - Programmable modes optimized for medium and short-range sensing applications
  - Customizable field of view (FoV) up to 180°
  - Multi-object detection
  - Works in sunlight and any other lighting
  - Insensitive to object color, detects optically transparent surfaces like glass windows
- Easy to integrate
  - Single sensor for receive and transmit
  - Single 1.8V supply
  - I<sup>2</sup>C Fast-Mode compatible interface, data rates up to 400 kbps
  - Dedicated programmable range interrupt pin
  - Platform-independent software driver enables turnkey range-finding
- Miniature integrated module
  - Compatible with standard SMD reflow
  - Low-power micro-controller running advanced ultrasound firmware
  - Operating temperature range: -40°C to 85°C
- Ultra-low supply current
  - 1 sample/s:
    - 13 μA (10 cm max range)
    - 15 μA (1.0 m max range)
  - 30 samples/s:
    - 33 μA (10 cm max range)
    - 130 μA (1.0 m max range)

## 1 SPECIFICATION

Test conditions:  $V_{DD} = 1.8\text{ V}$ ,  $T = 25^{\circ}\text{C}$ , General Purpose Rangefinder (GPR) firmware image loaded, stationary target rejection disabled.

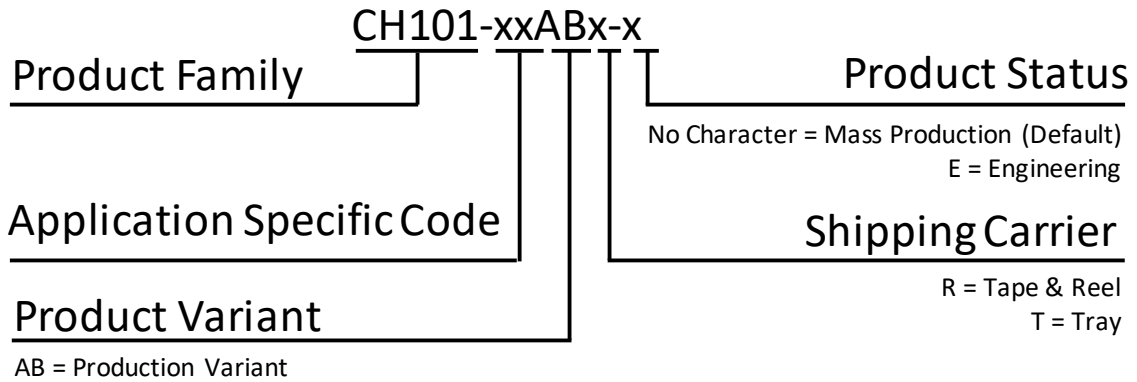

<b>Package</b>	8 pin LGA
<b>Size</b>	3.5 x 3.5 x 1.26 mm
<b>Operating voltage</b>	1.62 V to 1.98 V
<b>Operating temperature</b>	-40°C to 85°C
<b>I<sup>2</sup>C</b>	7-bit addressing 400 kHz Fast-mode
<b>Typical current consumption (Range finding mode)</b>	1 sample/sec: 13 $\mu\text{A}$ (10 cm max range) 15 $\mu\text{A}$ (1.0 m max range)  30 samples/sec: 33 $\mu\text{A}$ (10 cm max range) 130 $\mu\text{A}$ (1.0 m max range)
<b>Operating Range</b>	4 cm* to 1.2 m
<b>Range Noise</b>	1.0 mm RMS (@ 30cm in range)
<b>Measuring Rate</b>	Up to 100 samples/sec
<b>Field of View</b>	Up to 180°
<b>Latency</b>	1 ms (10 cm max range) 10 ms (1 m max range)
<b>Programming time</b>	60 ms

\*For non-stationary objects.

\*\*For optimum device performance the acoustic port must be open and clear of obstructions.

**Table 1. Specifications**

**2 PART NUMBERING**

This datasheet specifies the following part numbers

Part Number
CH101-00ABx-x
CH101-01ABx-x
CH101-02ABx-x
CH101-03ABx-x
CH101-04ABx-x
CH101-05ABx-x

### 3 CH-101 PINOUT

**Figure 1. 8-Pin Diagram**

PIN NUMBER	NAME	DESCRIPTION
1	INT	Interrupt output. Can be switched to input for trigger and calibration functions.
2	SCL	I <sup>2</sup> C Clock. This pin must be pulled up externally.
3	SDA	I <sup>2</sup> C Data. This pin must be pulled up externally.
4	PROG	Program enable. Cannot be floating.
5	VSS	Connect to Ground
6	VDD	Digital power
7	AVDD	Analog power
8	RESET_N	Active-low reset. Cannot be floating.

**Table 2. Pin Summary**

## 4 TYPICAL OPERATING CIRCUIT

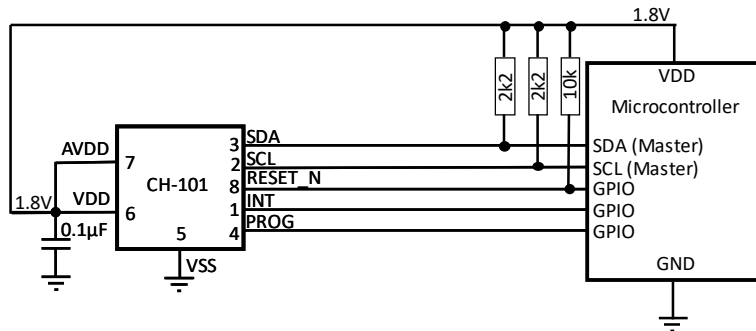

Figure 2. Single Transceiver Operation

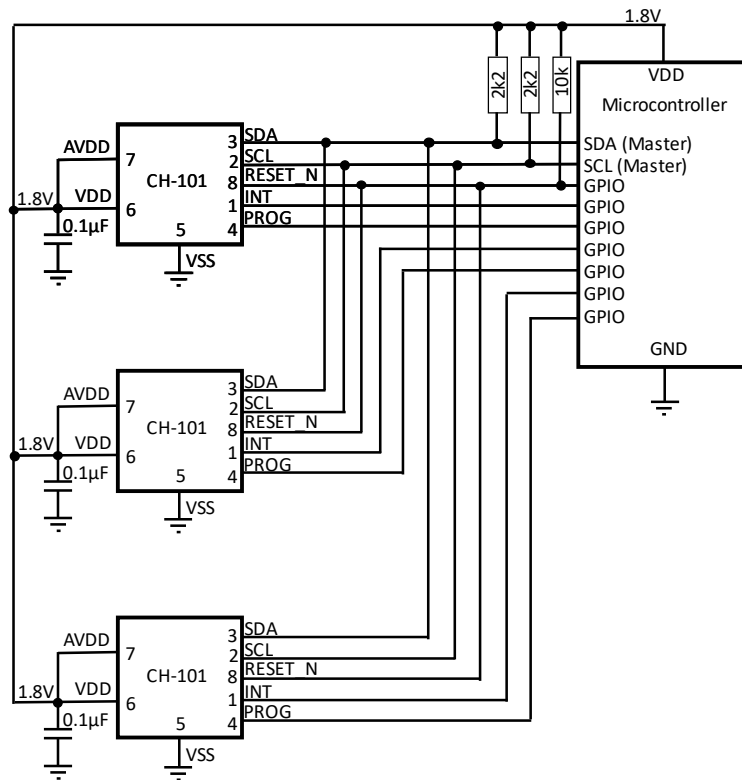

Figure 3. Multiple Transceiver Operation

## 5 THEORY OF OPERATION

The CH-101 is an autonomous, digital output ultrasonic rangefinder. Figure 4 shows the package-level block diagram. Inside the package are a micromachined ultrasonic transducer (MUT) and application specific integrated circuit (ASIC). The MUT produces pulses of ultrasound that reflect off targets in the transceiver’s field-of-view (FoV). The reflections are picked up by the same MUT after a short time delay, amplified by sensitive electronics, digitized, and further processed to produce the range to the primary target.

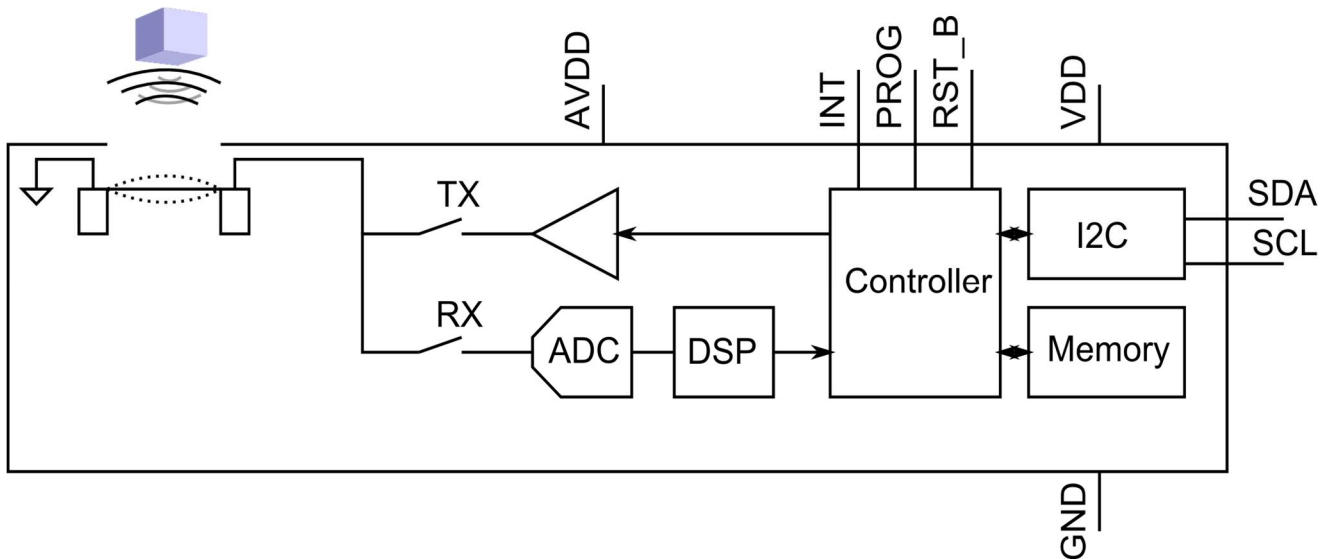

Figure 4. CH-101 Block Diagram

The time it takes the ultrasound pulse to propagate from the sensor to the target and back is called the time-of-flight. The distance to the target is found by multiplying the time-of-flight by the speed of sound and dividing by two (to account for the round-trip). The speed of sound in air is approximately 343 m/s. The speed of sound is not a constant but is generally stable enough to give measurement accuracies within a few percent error.

A time-of-flight ultrasonic rangefinder has several advantages over more common IR intensity-based transceivers. The range measurement is not sensitive to the size, color, or reflectivity of the target and the transceiver is insensitive to ambient light. Additionally, a maximum range of up to 1.2 m is supported, and the power consumption is up to several orders of magnitude lower than that of IR proximity transceivers.

A CH-101 program file must be loaded into the on-chip memory at initial power-on. The program, or firmware, is loaded through a special I<sup>2</sup>C interface. Chirp provides a default general-purpose rangefinder (GPR) firmware that is suitable for a wide range of applications. This firmware enables autonomous range finding operation of the CH-101. It also supports hardware-triggering of the CH-101 for applications requiring multiple transceivers. Program files can also be tailored to the customer’s application. Contact Chirp for more information.

CH-101 has several features that allow for low power operation. An ultra-low-power, on-chip real-time clock (RTC) sets the sample rate and provides the reference for the time-of-flight measurement. The host processor does not need to provide any stimulus to the CH-101 during normal operation, allowing the host processor to be shut down into the lowest power mode until the CH-101 generates a wake-up interrupt. There is also a general-purpose input/output (INT) pin that can be used as a system wake-up source. The interrupt pin can be configured to trigger on motion or proximity.

## **6 CHIRP CH-101 DRIVER**

Chirp provides a compiler/device independent C driver for the CH-101 which greatly simplifies integration. The CH-101 driver implements high-level control of one or more CH-101s attached to one or more I<sup>2</sup>C ports on the host processor. The CH-101 driver allows the user to program, configure, trigger, and readout data from the CH-101 through use of C function calls without direct interaction with the CH-101 I<sup>2</sup>C registers. The CH-101 driver only requires the customer to implement an I/O layer which communicates with the host processor's I<sup>2</sup>C hardware and GPIO hardware. Chirp highly recommends that all new designs use the CH-101 driver.

## 7 INTERFACING TO THE CH-101

The CH-101 communicates with a host processor over the 2-wire I<sup>2</sup>C protocol. The CH-101 operates as an I<sup>2</sup>C slave and responds to commands issued by the I<sup>2</sup>C master.

The CH-101 contains two separate I<sup>2</sup>C interfaces, running on two separate slave addresses. The first is for loading firmware into the on-chip program memory, and the second is for in-application communication with the CH-101. The programming address is 0x45, and the application address default is 0x29. The application address can be reprogrammed to any valid 7-bit I<sup>2</sup>C address.

The CH-101 uses clock stretching to allow for enough time to respond to the I<sup>2</sup>C master. The CH-101 clock stretches before the acknowledge (ACK) bit on both transmit and receive. For example, when the CH-101 transmits, it will hold SCL low after it transmits the 8th bit from the current byte while it loads the next byte into its internal transmit buffer. When the next byte is ready, it releases the SCL line, reads the master's ACK bit, and proceeds accordingly. When the CH-101 is receiving, it holds the SCL line low after it receives the 8th bit in a byte. The CH-101 then chooses whether to ACK or NACK depending on the received data and releases the SCL line.

Figure 5 shows an overview of the I<sup>2</sup>C slave interface. In the diagram, 'S' indicates I<sup>2</sup>C start, 'R/W' is the read/write bit, 'Sr' is a repeated start, 'A' is acknowledge, 'P' is the stop condition. Grey boxes indicate the I<sup>2</sup>C master actions; white boxes indicate the I<sup>2</sup>C slave actions.

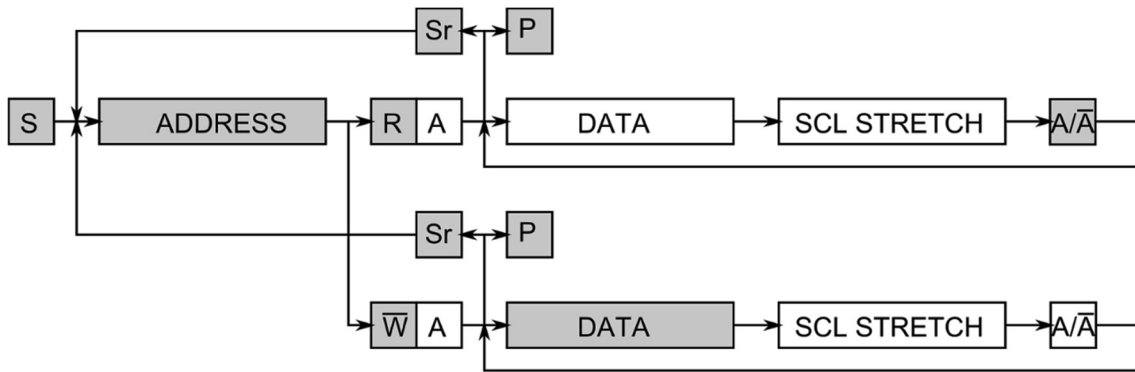

Figure 5. CH-101 I<sup>2</sup>C Slave Interface

## **8 DEVICE MODES OF OPERATION**

### **8.1 FREE-RUNNING MODE**

In the free-running measurement mode, the CH-101 runs autonomously at a user specified sample rate. In this mode, the INT pin is configured as an output. The CH-101 pulses the INT pin high when a new range sample is available. At this point, the host processor may read the sample data from the CH-101 over the I<sup>2</sup>C interface.

### **8.2 HARDWARE TRIGGERED MODE**

In the hardware triggered mode, the INT pin is used bi-directionally. The CH-101 remains in an idle condition until triggered by pulsing the INT pin. The measurement will start with sub-microsecond latency relative to the rising edge on INT. This mode is most useful for synchronizing several CH-101 transceivers. The host controller can use the individual INT pins of several transceivers to coordinate the exact timing.

### **8.3 STANDBY MODE**

The recommended way to put the CH-101 into low power standby mode is to use the free-running mode with PERIOD=0 and TICK\_INTERVAL=2048.

**11 TAPE & REEL SPECIFICATION**

**Figure 9. CH-101 Tape and Reel Specification**

Reel size is 1000 units, Minimum Order Quantity (MOQ) is 1000 units and in multiples of 1000 units.

## 12 SHIPPING LABEL

A Shipping Label will be attached to the reel, bag and box. The information provided on the label is as follows:

Device: This is the full part number

Lot Number: Chirp manufacturing lot number

Date Code: Date the lot was sealed in the moisture proof bag

Quantity: Number of components on the reel

2D Barcode: Contains Lot No., quantity and reel/bag/box number
