REFLOW SOLDERING

Consider the "IPC-7530 Guidelines for temperature profiling for mass soldering (reflow and wave) processes, published 2001. **Only single reflow soldering processes are recommended for REYAX modules. Repeated reflow soldering processes and soldering the module upside down are not recommended.**

Preheat phase

Initial heating of component leads and balls. Residual humidity will be dried out. Please note that this preheat phase will not replace prior baking procedures.

- Temperature rise rate: max. 3 °C/s If the temperature rise is too rapid in the preheat phase it may cause excessive slumping.
- Time: 60 - 120 s If the preheat is insufficient, rather large solder balls tend to be generated.
  Conversely, if performed excessively, fine balls and large balls will be generated in clusters.
- End Temperature: 150 - 200 °C If the temperature is too low, non-melting tends to be caused in
  areas containing large heat capacity.

Heating/ Reflow phase

The temperature rises above the liquidus temperature of 217°C. Avoid a sudden rise in temperature as the slump of the paste could become worse.

- Limit time above 217 °C liquidus temperature: 40 - 60 s
- Peak reflow temperature: 245 °C

Cooling phase

A controlled cooling avoids negative metallurgical effects (solder becomes more brittle) of the solder and possible mechanical tensions in the products. Controlled cooling helps to achieve bright solder fillets with a good shape and low contact angle.

- Temperature fall rate: max 4 °C/s To avoid falling off, the REYAX module should be placed on the topside of the motherboard during soldering.

PCB LAYOUT GUIDE

[1] Avoid placing any metal material between the RYS8830 and the sky.

[2] The best placement of the module is at the center of the PCB but close to the edge; keep at least
10 mm distance to the nearest ground plane corner.

[3] The height >2mm components should be placed at least 5 mm away from the RYS8830.

[4] The minimum distance between the plastic cover and the RYS8830 should be 1mm.

[5] The Placement of the module should keep a minimum distance of 5 mm from the human body
or the animal.

[6] The optimum PCB size is 78x 40 mm, but a larger or smaller ground plane can be used. The
suggested minimum ground plane size is 45 x 25mm.

[7] Place more GND via hole as close as possible to the RYS8830.

[8] Keep the VDD voltage ripple under 30mVpp.

[9] Avoid placing the module at the corner and center of the PCB. This will reduce the efficiency of
the signal.
