

## Second prototype

My group and I began to create another prototype meanwhile we still working on the first one. We have split our team in 2 to work in these two pros. Second prototype don't use rails system as the first pro. and it will be more manual. Actually we're trying to improve the stability by making a taller base and the security so it doesn't hurt himself by falling. (For instance: wrist rest, possibility to take off his wrist while falling.) We have reduced in the first prototype the quantities of materials ensuring security, lightness.
