# snickerdoodle

# GETTING STARTED GUIDE

# JUNE 10, 2016

# How to Read this Document

This document makes extensive use of links, references and notices in the page margins to detail additional information that can be useful while following the guide.

WARNING A warning notice indicates a potential hazard. If care is not taken to adhere to the safety precautions, damage may be done to snickerdoodle.

Warnings and cautions will be clearly visible in either the body of the text or in the margin and must be paid close attention while following the guided steps.

**CAUTION** A caution indication denotes a process that requires special attention. If the caution is not exercised and the process not adhered to, failure may result and/or potential damage to snickerdoodle.

## **Keywords**

Keywords and important terms are shown in *italicized* type. Additional important information can be found in the margins of text with superscript notation<sup>1</sup>.

Navigation of menus and directories are shown using **bold italicized** type. Any hierarchical navigation is shown using an arrow to denote a **Parent**  $\rightarrow$  **child** relationship.

Teletype text is used to highlight inputs, variables and system files within the host environment.

Warning, caution and informational notices, such as this one, may also be found in the margin.

i

<sup>1</sup> Margin notes, such as this one, reference the body content and highlight technical details or references for further information.

#### Introduction

This guide is intended to get you started running Linux (Ubuntu port provided by Linaro and developed by krtkl) on snickerdoodle. This guide uses programs and utilities on a Linux host computer (or virtual machine) to install a complete Linux system that snickerdoodle will boot from a microSD card. A Linux (krtkl recommends the latest LTS release from Ubuntu) system with the ability to mount a microSD card (UHS Speed Class 3 recommended) is required to install the Linux system.

# **Formatting SD Card**

#### Locating SD Card on System

The mount command can be used to locate the SD card device, once it has been connected to the host computer. In the example below, an SD card has been connected on /dev/sdb1 and mounted at /media/user/UNTITLED.

```
user@ubuntu:~$ mount
/dev/sda1 on / type ext4 (rw,errors=remount-ro)
proc on /proc type proc (rw,noexec,nosuid,nodev)
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)
none on /sys/fs/cgroup type tmpfs (rw)
none on /sys/fs/fuse/connections type fusectl (rw)
none on /sys/kernel/debug type debugfs (rw)
none on /sys/kernel/security type securityfs (rw)
udev on /dev type devtmpfs (rw,mode=0755)
devpts on /dev/pts type devpts (rw,noexec,nosuid,gid=5,mode=0620)
tmpfs on /run type tmpfs (rw,noexec,nosuid,size=10%,mode=0755)
none on /run/lock type tmpfs (rw,noexec,nosuid,nodev,size=5242880)
none on /run/shm type tmpfs (rw,nosuid,nodev)
none on /run/user type tmpfs
    (rw,noexec,nosuid,nodev,size=104857600,mode=0755)
none on /sys/fs/pstore type pstore (rw)
binfmt_misc on /proc/sys/fs/binfmt_misc type binfmt_misc
    (rw,noexec,nosuid,nodev)
systemd on /sys/fs/cgroup/systemd type cgroup
    (rw,noexec,nosuid,nodev,none,name=systemd)
gvfsd-fuse on /run/user/1000/gvfs type fuse.gvfsd-fuse
    (rw,nosuid,nodev,user=russellbush)
/dev/sdb1 on /media/user/UNTITLED type vfat
    (rw,nosuid,nodev,uid=1000,gid=1000,shortname=mixed,dmask=0077,
    utf8=1, showexec, flush, uhelper=udisks2)
```

Figure 1: SD Card UHS Speed Class Marking (adapted from https://www.sdcard. org/consumers/speed\_speed\_class/)

#### Partitioning the SD Card (fdisk)

Before partitioning the SD card, any partitions that have been mounted on the system must be unmounted. This can be done using the umount command.

```
$ umount /dev/sdb1
```

Once the SD card has been located, we can partition it for the Linux system (*BOOT* partition) and root filesystem (*ROOTFS* partition) using  $fdisk^2$ . fdisk must be run with root permissions (sudo) using the disk parent as the argument (do not use the parition number in the argument).

\$ fdisk /dev/sdb

From within the fdisk interface, we can view the parition table at any time using the 'p' command. In this example, an 8GB SD card with a single FAT32 partition is being used and will be re-partitioned for snickerdoodle.

```
Command (m for help): p
```

```
Disk /dev/sdb: 7969 MB, 7969177600 bytes

255 heads, 63 sectors/track, 968 cylinders, total 15564800 sectors

Units = sectors of 1 * 512 = 512 bytes

Sector size (logical/physical): 512 bytes / 512 bytes

I/O size (minimum/optimal): 512 bytes / 512 bytes

Disk identifier: 0x00000000

Device Boot Start End Blocks Id System

/dev/sdb1 8192 15564799 7778304 b W95 FAT32
```

### **BOOT Partition**

First, a partition must be allocated for the Linux system binaries and files. This includes B00T.bin (FSBL, bitstream, U-Boot), uEnv.txt, devicetree.dtb, and the Linux kernel uImage. The partition size for these files is recommended to be 128MB in size which translates to an additional 262144, 512 byte sectors.

```
Command (m for help): d
Selected partition 1
Command (m for help): n
Partition type:
```

<sup>2</sup> Additional information on fdisk can be found at: http://tldp.org/HOWTO/ Partition/fdisk\_partitioning.html

CAUTION Do NOT include any partition number (in the example case '1') when running fdisk on the SD card. '/dev/sdb' NOT '/dev/sdb1'

```
p primary (0 primary, 0 extended, 4 free)
e extended
Select (default p): p
Partition number (1-4, default 1): 1
First sector (2048-15564799, default 2048): <RETURN>
Using default value 2048
Last sector, +sectors or +size{K,M,G} (2048-15564799, default
15564799): +262144
```

The default partition type for fdisk is **Linux** (type ID 83). The *BOOT* partition needs to be formatted as **FAT32** (type ID 'C'). Do do this, the 't' command is used:

```
Command (m for help): t
Partition number (1-4): 1
Hex code (type L to list codes): c
Changed system type of partition 1 to c (W95 FAT32 (LBA))
```

## **ROOTFS Partition**

Second, a partition for the root filesystem must be created. This partition will be formatted as a **Linux** type using type ID 83. This is the default partition type.

```
Command (m for help): n
Partition type:
    p primary (1 primary, 0 extended, 3 free)
    e extended
Select (default p): p
Partition number (1-4, default 2): <RETURN>
Using default value 2
First sector (264193-15564799, default 264193): <RETURN>
Using default value 264193
Last sector, +sectors or +size{K,M,G} (264193-15564799, default
    15564799): <RETURN>
Using default value 15564799
```

Before writing the parition table, you should verify the partition layout by printing it with the 'p' command. In this example, an 8GB SD card has been partitioned with a 128MB FAT32 *BOOT* partition and the rest allocated for a Linux *ROOTFS* partition.

Always check the partition table before attempting to write it to the disk, using the 'p' command.

Command (m for help): p

Disk /dev/sdb: 79	969 MB, 7969	177600 bytes			
255 heads, 63 se	ctors/track,	968 cylinde	rs, total 1	5564	800 sectors
Units = sectors of	of 1 * 512 =	= 512 bytes			
Sector size (log:	ical/physica	al): 512 byte	s / 512 byt	es	
I/O size (minimur	n/optimal):	512 bytes /	512 bytes		
Disk identifier:	0x00000000				
Device Boot	Start	End	Blocks	Id	System
/dev/sdb1	2048	264192	131072+	с	W95 FAT32
(LBA)					
/dev/sdb2	264193	15564799	7650303+	83	Linux

Once the partition table has been verified, the 'w' command can be used to write the table to the disk:

```
Command (m for help): w
The partition table has been altered!
Calling ioctl() to re-read partition table.
Syncing disks.
```

# Formatting Partitions (mkfs/mke2fs)

With a partitioned SD card, the partitions need to be formatted with the necessary filesystem type. For the *BOOT* partition, the filesystem type is **VFAT**. Formatting the *BOOT* partition can be done using the mkfs.vfat<sup>3</sup>. To format a FAT32 filesystem on /dev/sdb1 with a 'BOOT' disk label, the following command can be used:

<sup>3</sup> Additional information on mkfs/mke2fs and it's front end tools can be found at: http://www.tldp.org/HOWTO/ Partition/formatting.html

\$ mkfs.vfat -n BOOT /dev/sdb1

The format for the *ROOTFS* partition can be done with mke2fs which will format a Linux partition with an ext2/ext3/ext4 filesystem. To format an ext4 filesystem on /dev/sdb2 with a block size of 1k (1024) and a 'ROOTFS' disk label, the following command can be used:

\$ mke2fs -b 1024 -t ext4 -L ROOTFS /dev/sdb2

If the formatting is successful, the following output with be written to the console (writing superblocks and filesystem accounting information can take some time depending on the size and speed of the SD card): CAUTION When formatting disk partitions, make sure the disk partitions are NOT mounted.

mke2fs 1.42.9 (4-Feb-2014) Filesystem label=R00TFS OS type: Linux Block size=4096 (log=0) Fragment size=4096 (log=0) Stride=0 blocks, Stripe width=0 blocks 478208 inodes, 7650300 blocks 382515 blocks (5.00%) reserved for the super user First data block=1 Maximum filesystem blocks=74973184 934 block groups 8192 blocks per group, 8192 fragments per group 512 inodes per group Superblock backups stored on blocks: 8193, 24577, 40961, 57345, 73729, 204801, 221185, 401409, 663553, 1024001, 1990657, 2809857, 5120001, 5971969 Allocating group tables: done Writing inode tables: done Creating journal (32768 blocks): done Writing superblocks and filesystem accounting information: done

After the partitions have been properly formatted, the SD card must be ejected and re-connected before moving the Linux boot components and root filesystem contents to the disk.

\$ eject /dev/sdb

#### **Sources**

#### **BOOT Partition Components**

The latest *BOOT* partition Linux components for Snickerdoodle and Snickerdoodle Black can be downloaded using git.

```
$ git clone
https://github.com/krtkl/snickerdoodle-linux-prebuilt.git
```

Alternatively, the sources can be downloaded directly from a web browser from the krtkl GitHub page as a .ZIP file.

Figure 2: Download prebuilt Linux components from GitHub

## Copy Files to SD Card

After downloading the SD card components

The *BOOT* components can be installed onto the SD card using the cp command, starting with BOOT.bin. In this example, the files are copied to the *BOOT* partition that has been mounted at /media/user/BOOT. As stated above, the mount command can be used to locate the mount point of the SD card partitions.

- \$ cp BOOT.bin /media/user/BOOT
- \$ cp uEnv.txt /media/user/BOOT
- \$ cp devicetree.dtb /media/user/BOOT
- \$ cp uImage /media/user/BOOT

After copying the *BOOT* components, the sync command should be used to make sure the system buffers have been flushed and the process of writing the files to the SD card is complete.

\$ sync

# **ROOTFS Sources**

The root filesystem can be extracted directly into the *ROOTFS* partition using the '-C' argument when extracting the archive contents. In this example, the *ROOTFS* partition is mounted at /media/user/R00TFS, which should be checked before attempting to extract the root filesystem. The root filesystem contains a lot of large packages (ROS, python, etc.) and may take several minutes to complete the process of writing to the SD card.

\$ tar -C /media/user/ROOTFS -xvzf snickerdoodle-ubuntu-14.04.tar.gz

After extracting the root filesystem to the SD card, use the sync command to flush the system buffers and ensure the write process is complete. Additionally, making sure to unmount the SD card partitions before ejecting will make certain that any lingering write processes have completed before the SD card is removed.

\$ sync

\$ umount /dev/sdb1

\$ umount /dev/sdb2

Now that the microSD card has been partitioned, formatted and populated with the Linux files, it is ready to be installed onto snickerdoodle and booted. Install the microSD card into the card cage (J3) and connect power on either the micro USB connector (J1) or the power pins on J2. The familiar Ubuntu boot console should start and you will have access to a terminal to begin configuration and development of snickerdoodle.

Figure 3: snickerdoodle SD Card Connector with Installed microSD Card

Welcome to Ubuntu 14.04 (GNU/Linux 3.14.0-xilinx-dirty armv7l)

\* Documentation: http://www.ubuntu.com root@snickerdoodle:~/workspace# python hello\_world.py Congratulations! You've run your first python script on snickerdoodle!

SNICKERDOODLE GETTING STARTED GUIDE
